E.C. McCready

Water, magical - everywhere, liquid, solid and ice-liquid forms have dissolved into nearly everything. Its blessing and its curse is introduced, and we're the creatures that have come along - ugly, from the pollution; global warming's messy concoction is the "primordial soup" and powerful force that is to be harnessed.

Earth has become a toxic waste site, a Chinatown where water battles, its ownership, its supply, and its distribution has required an engineering feat from where a massive amount of water can be diverted to Earth from the fertile deserts on Mars.

Gaseous forms, an invisible steam - water vapor has been enclosed in a man as a vessel with the ability to harness its expansive force. Along with the other two astronauts, they are coming to Mars to change its environment and multiply it for power by creating a new engine for both "progress" and of destruction, yet the physics of water, its relative shape that duplicates itself through-out the universe has deceived mankind. The engineering feat cannot be achieved.

Water has defined itself as a disordered state of unformed matter in its infinite space and has become a cosmological order in their universe where chaos is the only outcome.

Mediating between life and death, the astronaut as a vessel has become submerged in an abyss of himself. He has unleashed a flood of spiritual forces that are his overwhelming feelings that are rejecting the transmission of wisdom of the vapor. He has been overcome in the deepest domains of his body and soul, and he is taking his last voyage. He wants to end his life and its flow to our Earth mother while jeopardizing all life forms. His soul occupies itself with the souls of the dead and at where there is no next life or any rebirth.

The other two astronauts resist the contaminated vapor and its destruction and heed into it to divine and engineer a future source to avoid their perilousness.

The astronaut that has drifted into space as the vessel for the dimensions of water and is toxic to life is now a hydrologic that is a connection between the crew and Earth, and his containment has become the raw material of their creation, a chemical brew that's brought forth invisibly, "stealing" his vapor energy and remaking it into a love triangle for their molecular structures that are emerging in the astronaut's lives which become instruments of this transmission - intimately bonding them to Earth with this higher-plane consciousness.

The farmer's daughter at Farmer's Market, apple pie, hot-dogs and Chevrolets - moving cycles delicately balanced in their stunning gracefulness, these are the flitting images of Earth's system, the vessel, the life flow - the motherload, hometown girls!

Equilibrium on Earth isn't yet finely tuned, and water's natural physical anomaly has a high internal cohesion with a complex and toxic pattern of mankind that has been placed in their infinite variety of combinations for the human conditions that manifest creatures within their structure of human existence.

Pollutants through the hydrologic cycle is omnipresent with contaminants, and water - the source of life, is in a flow with our universe that's an anomaly of itself, which is in a toxic isolation on Earth, so the mission to reinvent the flow of the universe is undertaken on Mars to rediscover water's engineering there for a terrestrial cohesion with extraterrestrial information, its vapor transmissions as a vessel for the creation of life's information that's a duality of itself yet now cursed on Earth and in a battle to be blessed data.

The self-organizing universe is everywhere. There's water, but not a drop to drink! If we become "Martians," life on earth becomes more toxic and containment levels within the water creates more creatures within us - a flow of death, ignorance and even hatred.

Billions upon billions of toxic chemicals are being carried in mankind's bodies: waste water responsible for the sexual mutations of non-life forms that will destroy the life-flow on Earth as we know it?

Is there water on Mars?
